Blender Interface Final

The premise for my blender prototype is that I am creating a new dashboard management system for ChatGPT: Exploring the development of a dashboard for managing and optimizing GPT models, as currently, there is no dedicated dashboard for this purpose. After conducting my research, I have narrowed down the possible user base to power users with custom GPTS, ranging from engineers to developers. I have created a space where the user will be able to interact with the new dashboard and use a companion device.

In the previous week, I worked on creating the monitor for the display of my dashboard. I initially had trouble with adding the screen but then in class this week I was able to get help from the professor and added the screen seamlessly to the monitor. This week I focused on building out a space for the display, so I created a desk and a companion device.

I started with the desk which was the base for the display as well as the keyboard and companion device. I then designed the keyboard, which was heavily inspired by Apple so it looks nearly identical to the Apple Magic Keyboard. Finally, I built out the companion device which operates sort of like a MIDI with different touch pads to allow the user to have shortcuts.
